

# School IT Ticket Classification

## Customer Journey Map — Student / Teacher

Scenario: submitting, classifying, routing, and receiving confirmation for a school IT support request

| Entice                                                           | Enter                                                               | Engage                                                                    | Exit                                                                                 | Extend                                                                        |
|------------------------------------------------------------------|---------------------------------------------------------------------|---------------------------------------------------------------------------|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| What the person experiences                                      | What happens at this stage                                          | Interactions / system touchpoints                                         | What the person experiences                                                          | What happens at this stage                                                    |
| Issue occurs                                                     | Submit ticket                                                       | Automation runs                                                           | Ticket is routed                                                                     | Confirmation and resolution                                                   |
| Wi-Fi, projector, password, or slow-computer problem is noticed. | Open the ServiceNow form and provide Caller plus Short Description. | Record is created; Flow Designer checks keywords while Category is empty. | Category and Subcategory are assigned and the record is stored in Incident Workflow. | Caller receives an email; agent works the ticket through its state lifecycle. |
| User decides help is needed.                                     | Simple, low-effort form entry.                                      | No manual category selection is needed.                                   | IT agent receives consistent data.                                                   | User knows the request was received.                                          |

**Key experience goal:** the caller submits a clear description once, receives a confirmation, and the helpdesk gets a correctly classified ticket without manual rework.
