Team ID	Not specified in project brief
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution: Automated School IT Ticket Classification

The solution uses ServiceNow Flow Designer to classify school IT support requests from keywords, apply valid Category and Subcategory values, store a structured ticket, and notify the caller.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Students and teachers submit Wi-Fi, projector, password/login, and slow-computer issues. IT staff manually interpret each request, causing delays, routing errors, and inconsistent ticket data.
2	Idea / Solution description	Create an Incident Workflow table with structured fields. Trigger a no-code Flow Designer flow when a record is created and Category is empty; evaluate keywords and update Category, Subcategory, and caller notification.
3	Novelty / Uniqueness	The solution combines dependent choice logic, keyword-based classification, standardized ticket records, and email acknowledgement without custom scripting or machine learning.
4	Social Impact / Customer Satisfaction	Students and teachers receive faster confirmation and more predictable routing. IT agents spend less time on repetitive categorization and more time resolving issues.
5	Business Model (Revenue Model)	Internal school operations improvement rather than a direct revenue product. Value is measured through reduced manual effort, shorter routing time, and improved service quality.
6	Scalability of the Solution	New issue types and mappings can be added through configurable Flow Designer conditions, choice values, fields, and update sets; the pattern can extend to other departments.
