

ServiceNow Flow Designer

Project Documentation Format

1. Introduction

- Project Title: Auto Ticket Classification using Flow Designer
- Team Members: Not specified in the project brief; roles include product owner, ServiceNow administrator, IT helpdesk representative, and tester.

2. Project Overview

- Purpose: Automate classification of school IT support tickets at creation time, reduce manual effort, improve routing, and provide caller acknowledgement.
- Features: Incident Workflow table, auto-numbering, dependent Category/Subcategory choices, Flow Designer keyword branches, email notification, update-set deployment, and validation scenarios.

3. Architecture

- User interface: ServiceNow Incident Workflow form used by students, teachers, and IT agents.
- Automation: Flow Designer flow "Auto Classify School IT Tickets" triggers on record creation when Category is empty.
- Data: Structured fields include Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group, and Assigned to.
- Classification logic: WiFi/Network → Network / Wi-Fi; Projector → Hardware / Projector; Password/Login → Access / Forgot Password; Slow/Hanging → Performance / Slow Computer.
- Notification: Flow Designer sends confirmation to Caller → Email.

4. Setup Instructions

- Prerequisites: Authorized ServiceNow instance, administrator role, Incident Workflow table, Flow Designer, email configuration, and a current Project Update Set.
- Installation: Create the update set; create the custom table and fields; configure dependent choices; build and activate the flow; validate email; complete and export the update set.

5. Folder Structure

- Configuration artifacts: Update Set XML export, table and dictionary configuration, choice/dependency configuration, Flow Designer flow, email action, test evidence, and final documentation.
- Documentation structure: Requirement Analysis, Project Design, Project Planning, Project Development/UAT, and Project Documentation deliverables. No client/server source tree is used because this is a no-code ServiceNow implementation.

6. Running the Application

- User flow: Open the Incident Workflow form, enter Caller and Short Description, and save.
- The record is created and the active flow classifies it automatically.
- Administration flow: Open Flow Designer to review or maintain the active flow.
- Review system email logs for notification evidence. Use the Project Update Set to move configuration between environments.

7. API Documentation

- No external API endpoints are required. The solution uses native ServiceNow record, Flow Designer, reference, choice, and email actions. The primary record operation is creation/update of an Incident Workflow record.
- Request data: Caller, Short Description, Description, Category,

Subcategory, State, Assigned Group, and Assigned to. • Response

outcome: classified record, assignment-ready data, and caller

acknowledgement email.

8. Authentication

- Access is controlled through ServiceNow roles and permissions. Students/teachers submit ticket data; IT agents work records; administrators maintain tables, flows, update sets, and email configuration. Test credentials must not be stored in this document.

9. User Interface

- Primary UI is the ServiceNow Incident Workflow form. The form collects Caller and Short Description while the automation fills classification fields. The project-specific architecture and data-flow diagrams are included in the final report.

10. Testing

- Testing covers positive keyword cases, dependent choices, record integrity, email notification, response time, controlled burst creation, duplicate auto-number checks, and role-based access. UAT cases TC-001 to TC-006 and performance cases PT-01 to PT-03 are documented as execution plans pending environment evidence.

11. Screenshots or Demo

- Demo path: create a Wi-Fi or Projector ticket, save and reload, inspect

Category/Subcategory, then inspect the system email log. Evidence should be captured from the authorized ServiceNow instance during execution.

12. Known Issues and Future Enhancements: Keyword matching may require expansion for synonyms and unmatched descriptions; future work can add a fallback/manual-review route, more issue types, SLA dashboards, analytics, and richer audit reporting.
